```
to treat hemophilia, comprises at least a portion of Factor VIII operably linked to control sequence - \,
```

Example 9; Fig 6; 92pp; English

CC (rAAV) construct pVm4.1cPBdeltaB. This expression vector comprises the Crawly construct pVm4.1cPBdeltaB. This expression vector comprises the CC promoter, first intron (-573 to +985) of human elongation factor-lalpha CC (EFlalpha) gene, human Factor VIII coding sequence (hGH). This sequence is polyadenylation signal from human growth hormone (hGH). This sequence is first 57 bp encoding the 19 amino acid signal peptide, Al and A2 domains can satisfy a mino acids signal peptide, Al and A2 domains can segment comprises the N-terminus of the B domain. The light chain cC and 5 amino acids from the N-terminus of the B domain and the A3. CC and C2 domains. Both the heavy and light chain segments are cloned cC into the same plasmid seperated by 42 nucleotides coding for 14 residues control sequences, that directs the transcription and translation of the C factor VIII gene. The adeno-associated viral vectors are used for gene control treat haemophilia. This method allows prolonged expression of the therapy, because of their broad host range, safety profile and duration XX

Sequence 4999 BP; 1375 A; 1151 C; 1155 G; 1318 T; 0 other:

The present invention relates to a method for treating a subject suffering from a blood clotting disorder. The method comprises administering a recombinant adeno-associated virion (rAAV) comprising a nucleotide sequence encoding the light chain of factor VIII and a second recombinant adeno-associated virion comprising a nucleotide sequence encoding the heavy chain of factor VIII. The rAAV vector is
                                                                                                                 Claim 19; Fig 6; 90pp; English.

The ranv vector provides high level and long term expression of biologically active clotting factor VIII in vivo. expression of biologically active clotting factor VIII in vivo. The present sequence is profit levels become without the plasmid backbone. It comprises human elongation factor I (EF1) promoter, become in deleted human factor VIII coding sequence, a poly A signal and AAV inverted terminal repeats (ITRs) at the ends. The vector encodes both the light and heavy chains of human factor VIII separated by 14 amino acids of the B domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 4999 BP; 1375 A; 1151 C; 1155 G; 1318 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAD00121
                              CC and polyadenylation signal from human growth hormone (hGH). This sequence is inserted between the AAV inverted terminal repeat (ITR) regions. The CC first 57 bp encoding the la mino acid signal peptide, Al and A2 domains CC express the comprises the heavy chain gene segment with the CC and 5 amino acids from the N-terminus of the B domain. The light chain CC alone comprises the C-terminal 85 amino acids of B domain and the A3, CC express the beavy and light chain segments are cloned CC and C2 domains. Both the heavy and light chain segments are cloned CC into the same plasmid seperated by 42 nucleotides coding for 14 residues of the B domain, that is deleted. This plasmid is operably linked to CC of the B domain, that directs the transcription and translation of the CC control sequences, that directs the transcription are used for gene CC therapy to treat haemophilia. This method allows prolonged expression of therapy, because of their broad host range, safety profile and duration CC of expression in the infected hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     4840 tttgtgtgcggccgcaggaacccctagtgatggagttggccactccctctctgcgcgctc 4899

Sequence 11933 BP; 3258 A; 2818 C; 2717 G; 3140 T; 0 other;
                                  backbone. It comprises HNF-3.mouse albumin promoter, a synthetic intron based on human elongation factor lalpha (EPlalpha) and immunoglobulin G (IGG) intron sequences, B-domain deleted human factor VIII coding sequence, poly A signal based on rabbit beta-globin sequence and AAV inverted terminal repeats (ITRs) at the ends. The vector encodes both the light and heavy chains of human factor VIII.
                                                                                                                                   second recombinant adeno-associated virion comprising a nucleotide sequence encoding the heavy chain of factor VIII. The rAAV vector is useful in gene therapy for treating haemophilia A in mammals, in particular humans. The rAAV vector provides high level and long term expression of biologically active clotting factor VIII in vivo. The present sequence is paAV-FB-1 vector without the plasmid
                                                                                                                                                                                                                                            administering a recombinant adeno-associated virion (rAAV) comprising a nucleotide sequence encoding the light chain of factor VIII and a
                                                                                                                                                                                                                                                                                  The present invention relates to a method for treating a subject suffering from a blood clotting disorder. The method comprises

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Homo
                                                                                                                                    vector. The vector comprises a heterologous nucleotide sequence encoding B-domain deleted factor VIII operably linked with at least one enhancer and at least one promoter. The method results in the production of high titer rAAV vector stocks carrying the B-domain deleted factor VIII transgenes and expression cassettes, which generate adequate titers of virus for in vivo administration. The recombinant vectors are useful for treating haemophilia A, where the liver expresses the encoded B-domain deleted factor VIII, which is secreted into the blood. They are also useful for the treatment of other coagulation disorders. The present sequence encodes a B-domain deleted factor VIII.

                                                                                                                      When translated, Arg-740 of the carboxyl terminus of the H chain is directly bonded by a peptide bond to Glu-1649 of the amino terminus of L chain. It is used to transform animal cells so that they produce The expression vector is plasmid Ad.RE.neo. The expression vector has at least one promoter upstream of AAN90654. The transformants can constantly and continuously produce human Factor VIII:C in high yield on a commercial scale. The human Factor VIII:C so intact Factor VIII:C money and continuously produce human factor viiii: The formation in the human blood plasma. It is useful

                                                                                                                                                                                                                                                                                                                    10-AUG-1999
                                                                                                                                                                                                                                                                                             07-JUN-1995;
                                   This invention describes movel adenoviral vectors comprising at least one DNA sequence encoding a clotting factor (Factor IX or Factor VIII). The vectors of the invention have haemostatic activity. The vectors are useful for the treatment of hemophilia A or hemophilia B by gene therapy. This sequence represents human Factor VIII cDNA which has the B domain

In a novel, claimed synthetic gene (see AAV23288), non-preferred or favored by highly expressed human genes to provide high-level from 29 pairs of Oligonucleotides (see AAV23340-97) which served as AAV23289-91) are used for production of recombinant proteins in mammalian cells at levels of the invention (see also AAV23289-91) are used for production of recombinant proteins in the natural genes. They can also be used in gene therapy.

cc intravenously to a human. The long term systemic expression results in a cc intravenously to a human. The long term systemic expression results in a cc deasurable level of the therapeutic protein being produced in the blood cc of the human for a period of at least 30 days after the administration of cc the RRV vector preparation. RRV's can be used for in vivo delivery of cc therapeutic protein to treat, e.g. haemophilia A, haemophilia B, cc thrombosis, hypercoagulable disorders, liver diseases such as hepatitis, cc disorders such as thalasemia, phenylketonuria, Lesch-Nyhan syndrome, cc disorders such as thalasemia, phenylketonuria, Lesch-Nyhan syndrome, cc diabetes, hypopitutarism, adenine deaminase deficiency, alphal-cc diabetes, hypopitutarism, adenine deaminase deficiency, alphal-cc antitrypsin deficiency, Guacher's syndrome, anaemia, infections such as companied pressure, Alzheimer's disease, autoimmune or cc inflammatory disease or graft versus host disease. RRV's are capable of cc surviving inactivation in human serum thereby allowing efficient gene cc transfer over prolonged periods of time.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              expressing a therapeutic protein. The RRV preparation is resistant to degradation by human complement and is capable of inducing long term systemic expression of the therapeutic protein when administered
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            factor VIII. This is used in the construction of recombinant retroviral vectors expressing human factor VIII. The invention provides the preparation of replication defective recombinant retrovirus (RRV)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               02-JUL-1997;
     expressing a B domain-deleted human Factor VIII protein, where recombinant RV is capable of infecting human cells, is resistan to degradation by human complement and is capable of inducing long-term (at least 30 days and up to 6 months or longer post-injection) systemic expression of Factor VIII when administrated to a harmonician
                                                                           Factor VIII, the SQN deletion does not influence the in vivo pharmacokinetics, but the reduced size of the molecule appears to decrease proteolytic degradation. The invention relates to preparations of replication defective recombinant retrovirus (RV)
                                                                                                                                           deletion mutant SQN (see AAW44372) of human Factor VIII. The SQN mutant is created by fusing Ser-743 to Gln-1638 of native Factor VIII (see AAW44373) to form a Ser-Gln-Asn (SQN) link between the A2
                                                                                                                                                                                                                  Claim 6; Page 174-175; 236pp; English.

It was obtd. by PCR amplification (see also AAT69812-13) of the HCII acidic region from total liver cDNA, fusion to sequences encoding Factor VIII aa706-711 and aa737-743, and incorporation of the construct into plasmid pCLB-dB695. The hybrid protein, which can be expressed using gene therapy techniques, has increased procoagulant activity cowing to the HCII acidic region, and can be used to treat blood coagulation disorders such as haemophilia A.

Recondition relates to a method for expanding the population of CC endothelial cells (BC) obtained from peripheral blood, by culturing, CC in contact with a collagen I coated surface, buffy coat cells obtained CC in contact with a collagen I coated surface, buffy coat cells obtained CC in containing vascular endothelial growth factor (VEGF) and free of bovine CC containing vascular endothelial growth factor (VEGF) and free of bovine CC protein extract. EC are useful for treating hemophilia by introducing it CC from the blood stream of a mammal, so that an effective amount of CC protein extract is secreted in the blood stream of the mammal. CC Phis sequence represents a huamn factor VIII gene into which an CC enhanced green fluorescent protein coding sequence has been inserted. CC protein (eGFF); the last painto acids of the SQ linker peptide; an enhanced green fluorescent CC clomain extivation peptide; an enhanced green fluorescent CC clomain and the hfVIII C2 domain. Transgenic EC transduced in vitro CC are useful for improving prosthetic implants. EC is also useful for content of the activity of an enzyme. EC is also useful in gene CC deaminase deficiency, sickle cell anemia, thalassemia, hemophilia, CC domainse deficiency, sickle cell anemia, thalassemia, hemophilia, CC transition base and the variety of diseases including adenosaine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Expanding population of endothelial cells useful to biocompatibilize implantable medical devices comprises contacting buffy coat cells with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              18-DEC-1995;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               11-JUL-1996
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     W09621035-A2
                                                                                                                                                                                                                                                                                                             Sequence 8967 BP; 2841 A; 1898 C; 1833 G; 2395 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                         transduce cells either in vivo or ex vivo. Factor-VIII expressed from such transduced cells will be processed and transported in a fashion analogous to the expression product of a normal Factor-VIII gene. Retroviral particles harbouring such vectors will be useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 3; Page 58-68; 86pp; English.

The invention relates to human factor VIII mutants comprising an amino CC acid substitution at one or more positions in the A2 domain and/or an CC amino acid substitution at one or more positions in the C2 domain. CC The invention also encompasses a factor VIII mutant which lacks a B CC domain (AAB48842). The factor VIII mutants have an increased half-life CC in the bloodstream. The A2 domain mutants exhibit reduced LRP-dependent CC (receptor-dependent) clearance of factor VIII, while C2 domain mutants can be compassed to the compassed half-life CC have reduced receptor-independent clearance. The invention also relates CC to a method of using RAP (receptor associated protein), a protein which compassed the half-life of factor VIII. The mutant CC internalisation, to increase the half-life of factor VIII. The mutant CC factor VIII proteins, and nucleotides encoding them, are useful composed to a composition of the composition of the composition of the invention section of the invention. The invention with a mutant factor VIII protein or DNA of CC the invention. The invention provides means of increasing the half-life CC of factor VIII by reducing its clearance from plasma. The present content of the composition sequence represents cDNA encoding human factor VIII
